

Flashcache gains and the metal path

Measured gpt-oss-20b prompt-eval time over seven Printy turns, plus a 128KB trend projection.

WHAT WE ARE WORKING TOWARD

- 1 Measure every cache boundary
prefill, save, restore, I/O, copy, tail
- 2 Stop relying on whole-slot blobs
block layout, partial restore, eviction
- 3 Prefetch while agents use tools
make SSD latency hide behind work

Projection rule

128KB uses a linear fit from the measured 16/32/64KB ladder.

Metal target is an experiment goal, not a measured result.

MEASURED @ 64KB

11.4s saved

Direct 82.0s to Flashcache 70.6s.

PROJECTED @ 128KB

23.0s saved

Direct 164.9s to Flashcache 141.9s.

NEXT METAL TARGET

~25% savings

Partial KV restore, prefetch, better layout.
